FEEDBACK FOR HMI TEMPLATE
Date: 6 November 2022

SETTINGS

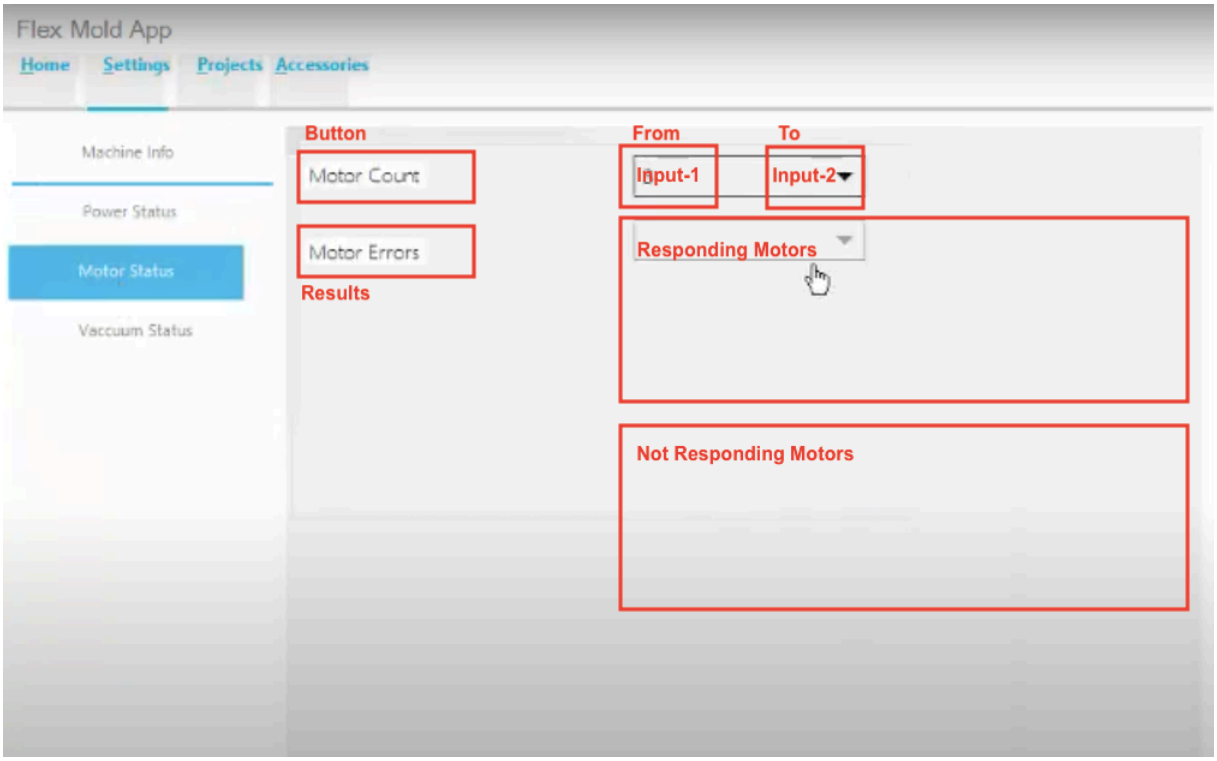

1- Machine Info data is filled by using the data which written in .txt file.

2- Power Status shows the power errors of motor PCB.

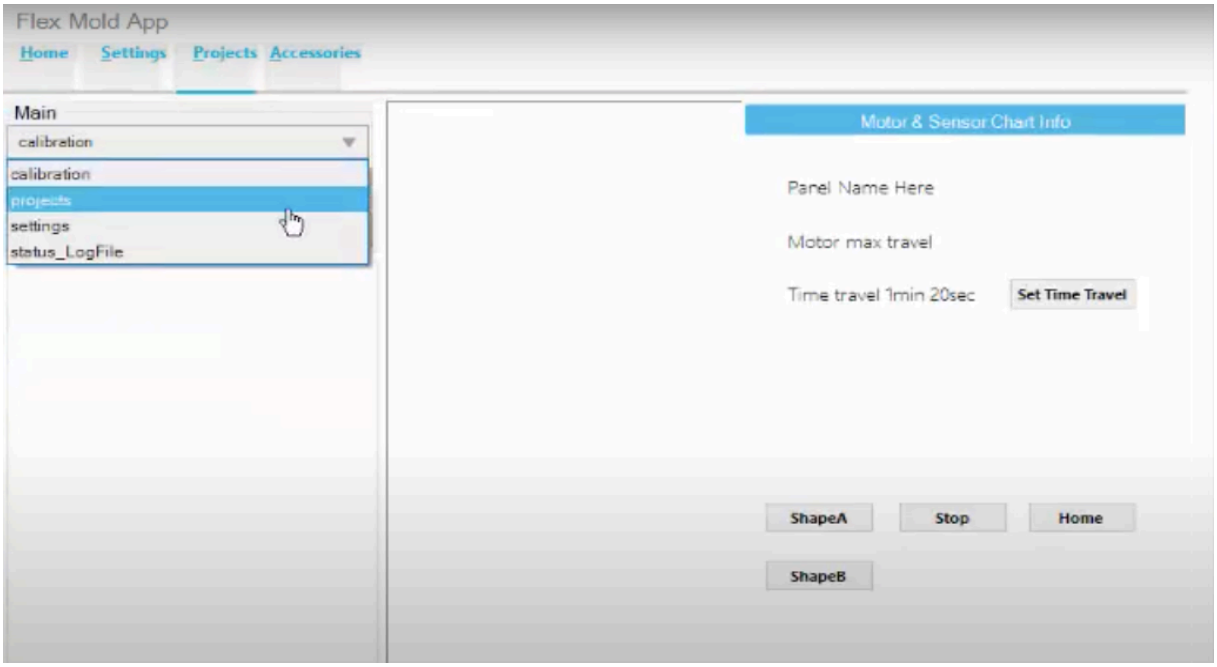

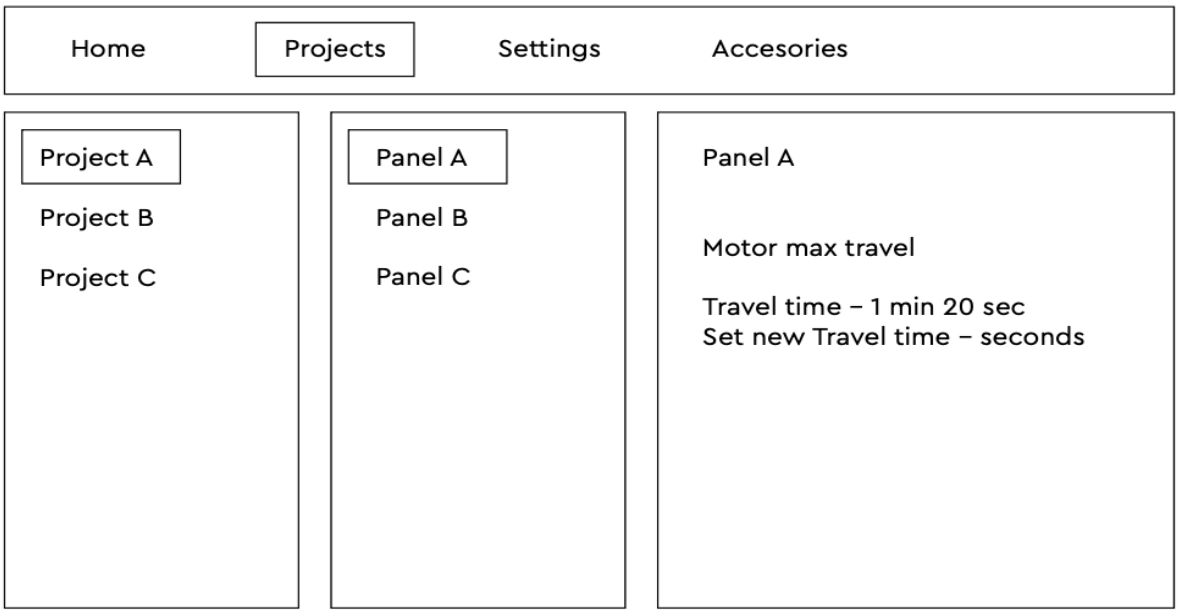

3- Motor Count is a button. When it is clicked, it will check the motor numbers from “input-1” to “input-2”. Its results have to be shown in two boxes. One is for responding motors and another one is for the motors not responding.

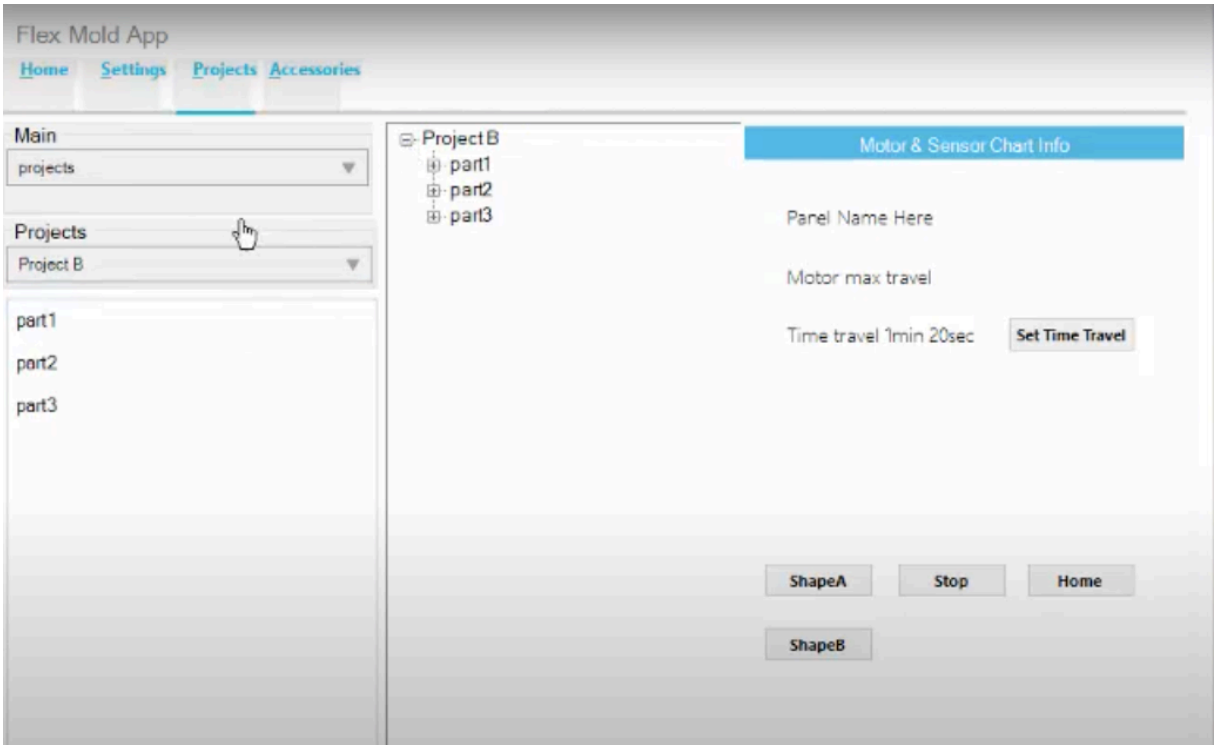

PROJECTS

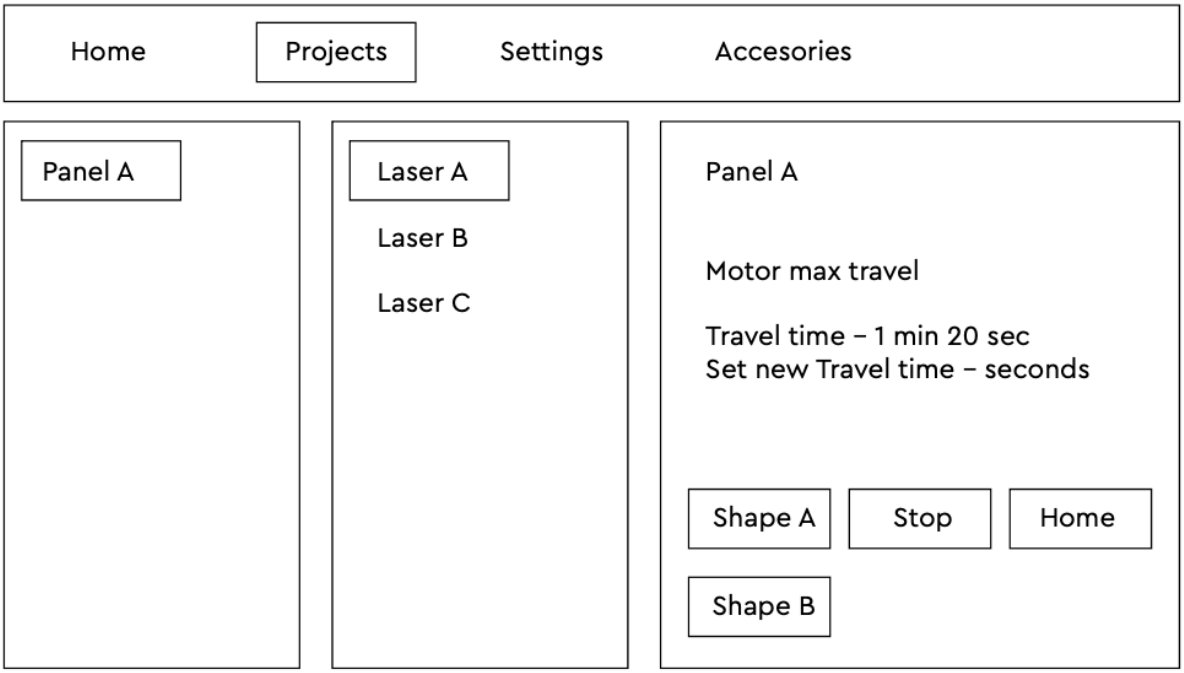

4- See the graphical outline. The left side is only for project folders and the middle part is panel folders in project folders. The right side is for panel info which is max travel and travel time (defined travel time).

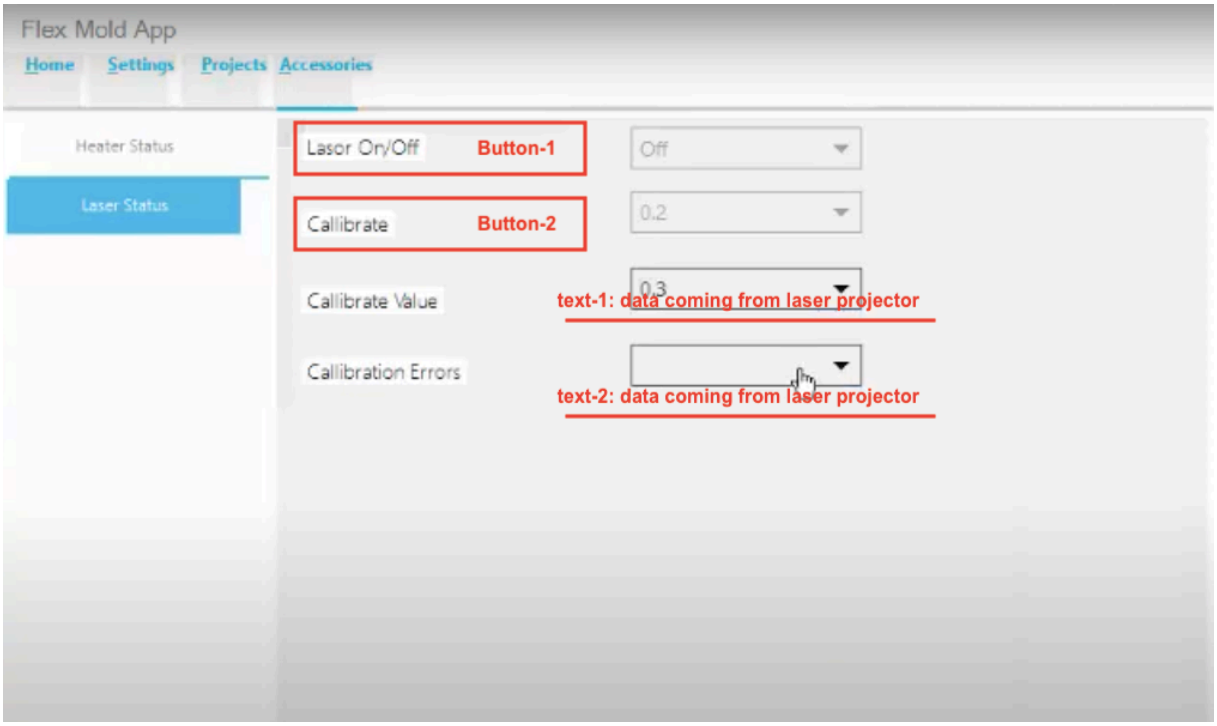

5- See the graphical outline. The left side is for panel name, middle part is ".las" file and right side is for the operation. Write the panel information.
6- Set input for travel time. "**Shape" button** is to shape panel the panel selected. **"Stop" button** is to stop the motor movement. **"Home" button** to turn the machine Home Position (its data under the calibration folder. Find …calibration/homePosition.csv). "**ShapeB**" button is to shape the next panel.
